

*CS 205M :*  
*Theoretical Foundations of Computer Science.*

*Khushraj Nanik Madhani*

# Lecture 1: Instructor and Teaching Assistants

- Khushraj Nanik Madhani (instructors):
- Teaching Assistants (yet to be decided):
  - Ritu Kumari (Ph.D. candidate),
  - Archana K R. (Ph.D. candidate),
  - Kethireddy Mahendranath Reddy (M.Tech. I),
  - Vishwa Pranav Reddy Bobbala (M. Tech. I).

# About the Course

*Discrete Mathematics 50%*

+

*Formal Languages and Automata Theory 50%*

# Discrete Mathematics (first half)

- Sets, Functions, Relations, Partial Orders, Recurrences, Summations;
- Counting, Generating functions, asymptotics;
- Elementary Logic and Proof Techniques.
- Graphs: basic concepts
- Group Theory, symmetries (if time permits).

# Formal Languages and Automata Theory

- Alphabets, Languages;
- Regular Languages:  
Finite State Automata, Regular Expressions;
- Context Free Languages:  
Pushdown Automata, Context Free Grammars;
- Recursively Enumerable Languages: Turing Machines;
- Introduction to Computability and Complexity (if time permits).

# Exam Schedule

- 5% lecture attendance, 95% exams;
- Quiz 1 (within a week before midsem);
- Mid Sem;
- Quiz 2;
- Quiz 3 (within a week before endsem);
- End Sem.
- 25% will be evaluated externally.

# Course Evaluation

- 5% lecture attendance; 25% quizzes (best of 2 out of 3), 5% research presentation;
- 20% midsem; 45% endsem.
- Potluck grading 15%.
  - Group of 5 will be formed after quiz 1 scores. Let the individual marks after endssems be  $A, B, C, D, E$ .
  - $A' = A - 0.15 * A, \dots, E' = E - 0.15 * E$ .
  - $X = 0.15 * (A + B + C + D + E) / 5$
  - $A_{\text{new}} = A' + X, B_{\text{new}} = B' + X, \dots, E_{\text{new}} = E' + X$ .

# *Conclusion*

*So its in your interest that your group members are also performing well and attending classes regularly.*

# Grading

*Partially Relative Grading. The absolute component as follows:*

- *Anyone getting 90% or above will get an AA or above.*
- *Anyone getting 80% or above will get AB or above.*
- *Anyone getting 36% or above will get CC or above.*

# Sets – revision.

- Intersection, Union, subset, superset, powerset.
- Relations – introduction.
- Functions.
- Cardinality of Sets, Finite vs. Infinite sets.
- Sequences and Summation.
- Will be revisited next week.

# Lecture 2: Introduction to Sets.

- A set is a collection of distinct objects.
- Denoted using curly braces:  $A = \{1, 2, 3\}$
- Elements are unordered and no duplicates.
- Membership notation:  $x \in A, y \notin A$

# Application of Set Theory

- Databases (SQL uses set operations).
- Programming (Python sets, Java HashSet).
- Logic and proof theory.
- Relations and functions.

# How to Define a Set?

- Roster Method: Explicit listing: issues with this?
  - $A = \{1, 2, 3, 4\}$
- Set-builder Notation: More precise, and unambiguous.
  - $B = \{x \mid x \text{ is an even number, } x < 10\}$

# Types of Sets

- Finite and Infinite Sets

- $A = \{1, 2, 3\}$  (finite),  $\mathbf{N} = \{0, 1, 2, 3, \dots\}$  (infinite)

- Empty Set:  $\emptyset = \{\}$ , Subset:  $A \subseteq B$  - every element of  $A$  is included in  $B$ ,

Superset  $B \supseteq A$ : vice versa. Universal Sets?

- Proper/Strict Subset:  $A \subset B$  means  $A \subseteq B$  and  $A \neq B$ ,

Proper/Strict Superset  $A \supset B$  means  $A \supseteq B$  and  $A \neq B$

# Elementary Set Operations.

- Union:  $A \cup B = \{x \mid x \in A \text{ or } x \in B\}$
- Intersection:  $A \cap B = \{x \mid x \in A \text{ and } x \in B\}$
- Difference:  $A - B = \{x \mid x \in A \text{ and } x \notin B\}$
- Complement:  $A' = \{x \mid x \notin A\}$  (w.r.t. a universal set)

# Venn Diagram

- *Visual Representation of sets and its operations: On board.*

# Properties of Set Operations

- Commutative:  $A \cup B = B \cup A, A \cap B = B \cap A$
- Associative:  $(A \cup B) \cup C = A \cup (B \cup C)$
- Distributive:  $A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$
- De Morgan's Laws:

$$\neg(A \cup B) = \neg A \cap \neg B, \quad \neg(A \cap B) = \neg A \cup \neg B$$

# Cartesian Product.

- $A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\}$
- Example:
- $A = \{1, 2\}, B = \{x, y\}$
- $A \times B = \{(1, x), (1, y), (2, x), (2, y)\}$

# Some Interesting Puzzles/Observations.

- Russel's paradox – issues with existing set theory – on board.
- Comparing infinities.
- Behind which door is the treasure. A liar and a truthful person.
- Paradox examples – escaping punishment.
- The Hydra.

# Elementary Logic

- Propositional Logic: Logical Operators, truth table, equivalence, rules of inference.
- First Order Logic.
